Inline Actions in Jewel

Simplification

Jan 2026

GOAL

Define a consistent POV for where actions belong and how they should look in Simplified Jewel

OBJECTIVE

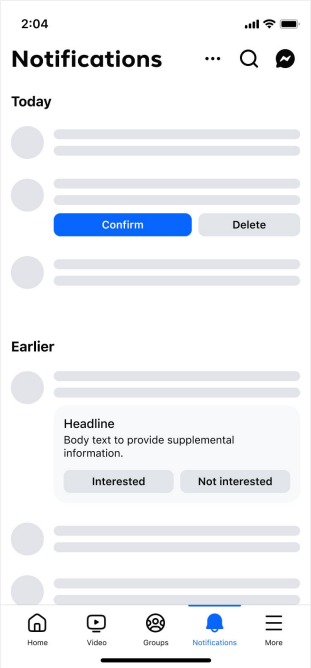
- Align on framework and design patterns for actions

- Align on POV changes:
  - Simplify Inline (Simple + Rich) CTAs
  - Usage of CTAs in Griffin
  - Dedicated QPs (in/out of Jewel)

THE 3 BUCKETS
PATTERNS WHERE ACTIONS CAN LIVE

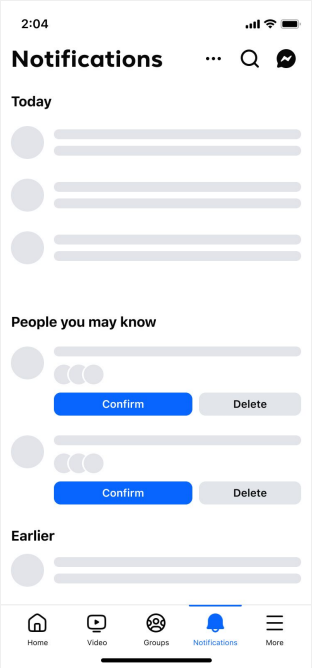
1

Inline



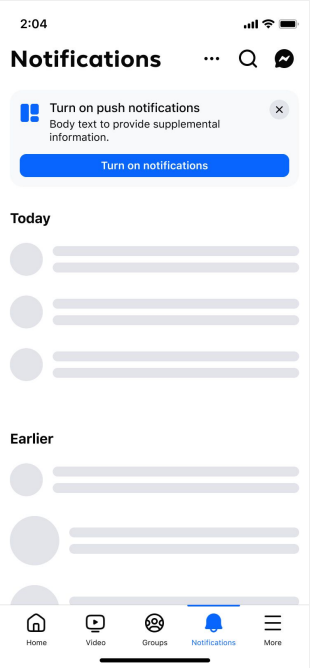
2

Section



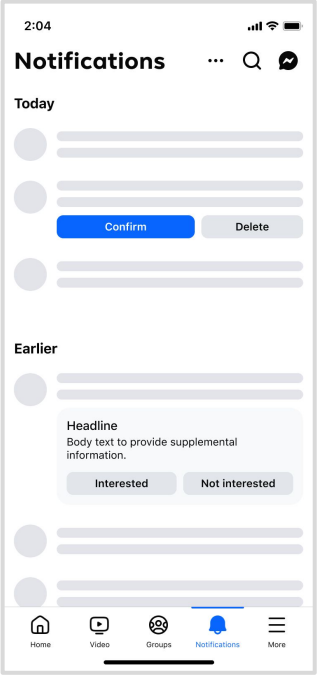
3

Dedicated QP



THE 3 GATES

FRAMEWORK FOR HOW WE DECIDE AN ACTION SHOULD BE INLINE



1

Distinct value

Inline actions must create a meaningfully different outcome than tapping the notification body.

2

Coupling

Inline actions should be **tightly coupled:** Directly resolves/changes state of that notification

Vs

Loosely coupled: Helpful but not required to resolve a specific notif (often feels “promo-ish” if placed inline)

3

Cost

Inline actions are displacement-heavy and should have the highest bar.

Showing actions in contained sections have more flexibility.

POV

Needs alignment

Simplify Inline CTAs

Today we have two types of inline CTAs in Jewel

1. **Simple Jewel CTA** that only displays a binary option related to the notification, and
2. **Rich Jewel CTA** that shares additional context before surfacing the inline actions

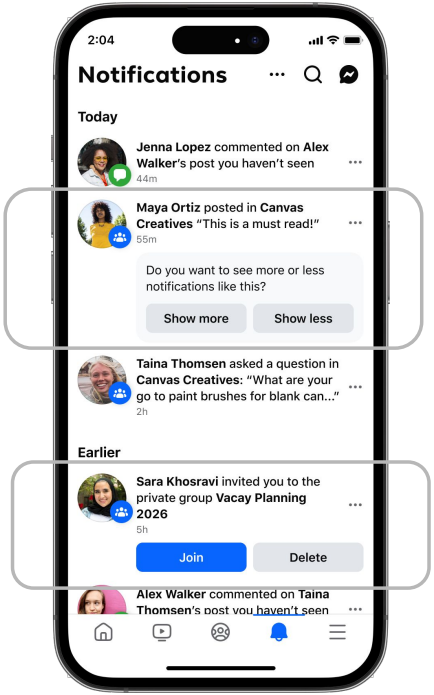
Proposed Solution: Lighter & Fewer Inline Formats

To address this, the proposal is to retain both inline CTA formats but to:
1. Implement a lighter design approach for each

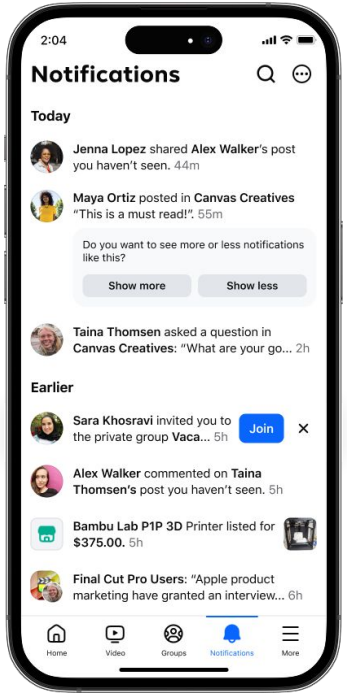
2. Update CTA guidelines NEEDS PRODUCT ALIGNMENT

- **Inline Simple CTA:** Define clear principles for usage, such as reserving it exclusively for reciprocal actions (e.g., "follow back") or other high-value social interactions (i.e follow)
- **Rich CTA:** Restrict its use to specific tightly couple control classes, like SMSL (show more/show less) and opt-in / opt-out control scenarios (i.e downgrading a notif).

BEFORE



AFTER



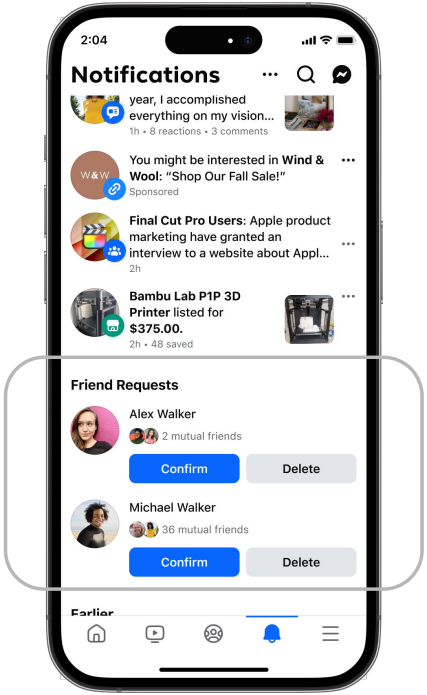
Simplify Griffin CTAs

Today, Jewel contains modules, visually distinct from Griffin notifications, each with their own Calls to Action (CTAs).

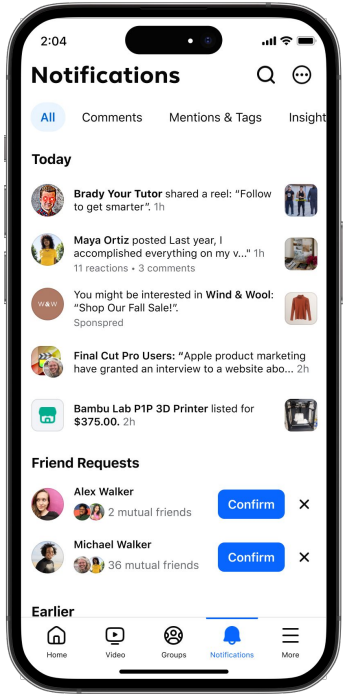
Proposed Direction

Maintain the Griffin formats for Friend Request (FR) and Friend Request Reminder (FRR), but simplify their appearance (make them lighter).

BEFORE



AFTER



Evolve Griffin CTAs

Challenge:
We are receiving requests from teams that would crowd the inline Call-to-Action (CTA) row, even for actions that may still be valuable.

Proposed Solution:
Evolve the existing Griffin CTAs pattern to accommodate these requests. This pattern is visually distinct and has a lower implementation cost than inline CTAs.

Rationale:
Inline actions heavily impact the layout (displacement-heavy). When the distinct value and cost of displaying an action inline are not justified, the section CTA provides an effective middle ground.

REVIEW OUTCOME: Not sponsored

The decision is to focus more on teams adhering to our principles or framework than finding middle ground. Any exceptions outside our principles would need executive approval

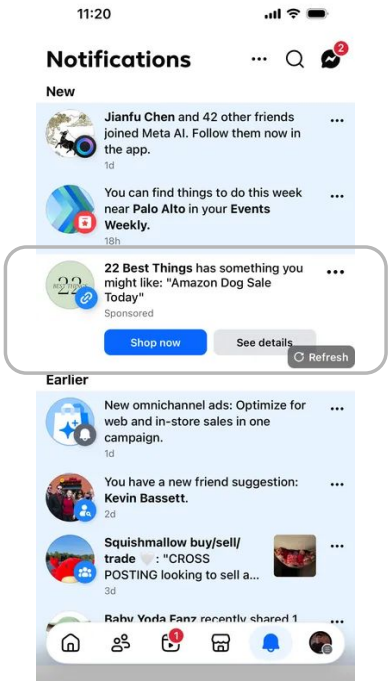
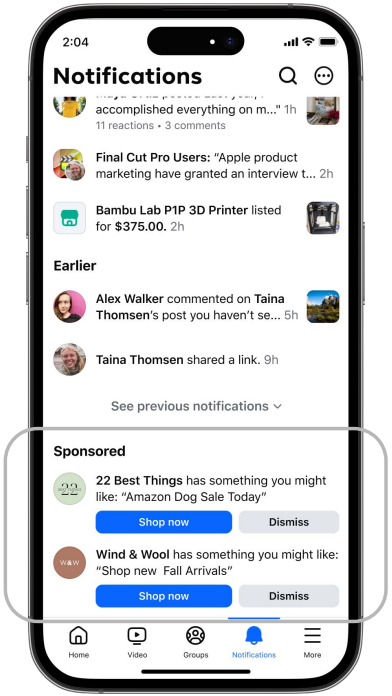
Experiment review



AFTER



Establish dedicated QPs

Problem: Some prompts aren't tied to a single notification row (e.g. push reachability upsell). We're referring to these as loosely connected

Proposed direction: Use a Top-of-Jewel prompt surface for notification experience prompts, such as:

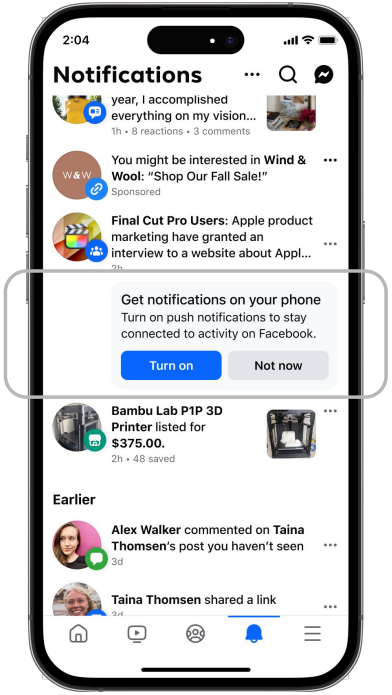
- Channel enablement (Push/Email)
- Notification control education / settings prompts

Decision / Open question: Do we have the appetite for a Top-of-Jewel prompt slot this half, or should we rely on existing surfaces (see next slide)?

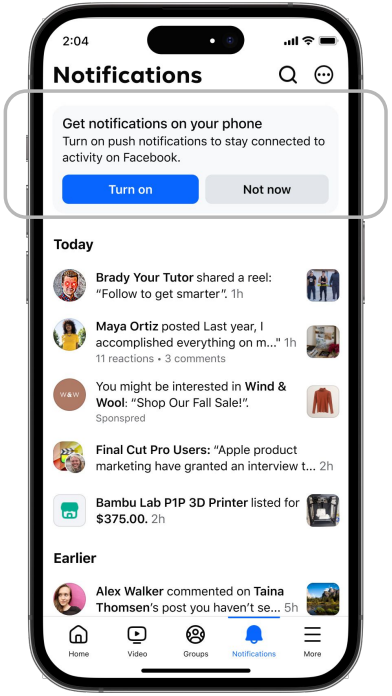
REVIEW OUTCOME: Not sponsored

The decision is to focus more on solving for simplifying or removing certain actions than migrating them

BEFORE



AFTER

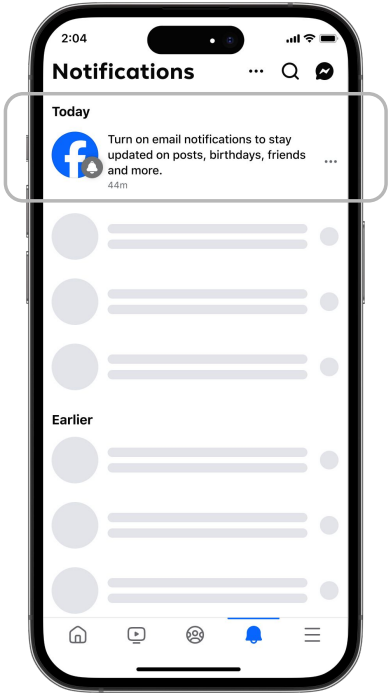


Use established QP systems when needed

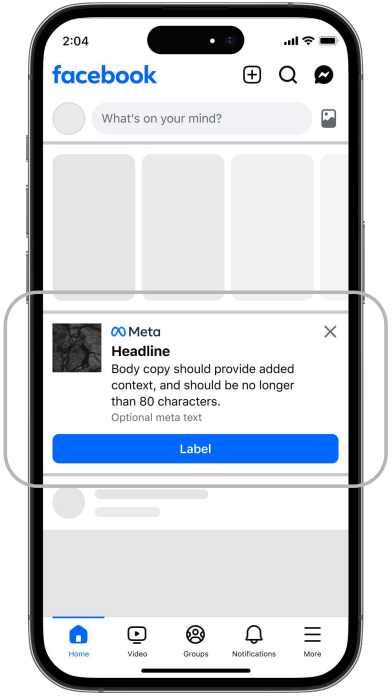
Problem: Some prompts are too broad for Jewel and compete with scanning notifications.

Proposed Direction: For non-Jewel-specific prompts, use Feed QP or other surfaces instead of new Jewel UI to keep Jewel focused on catch-up and actions within the notifications experience.

OPTION ONE
Use existing QP



OPTION TWO
Use QP outside Jewel

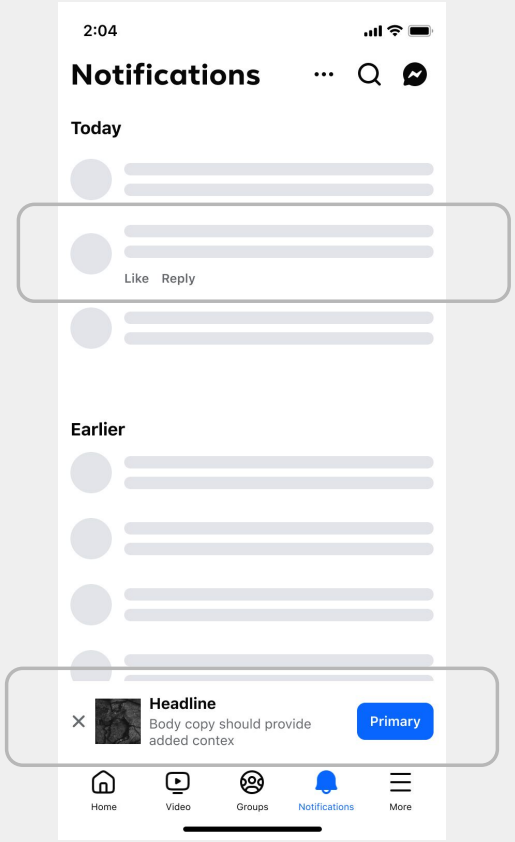


Appendix

Other patterns where actions live

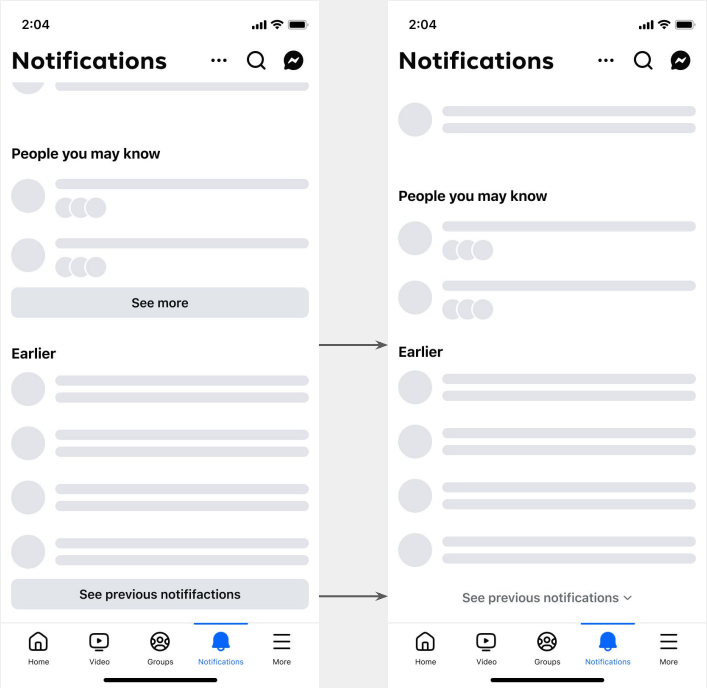
1. **Quick actions:** Like and Reply CTA on Jewel. Launched last half and has earlier precedence in creator notifications and other competitor apps like IG and TikTok

2. **Footer upsell**: Currently used for notification enablement upsell

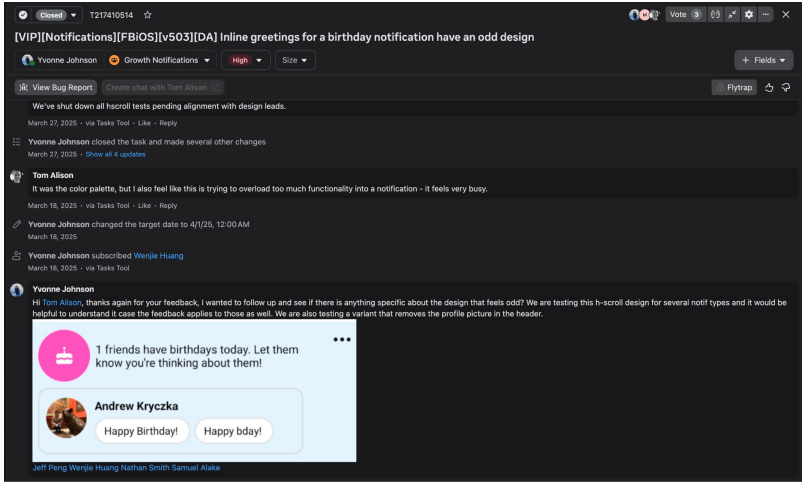


Other patterns where actions live

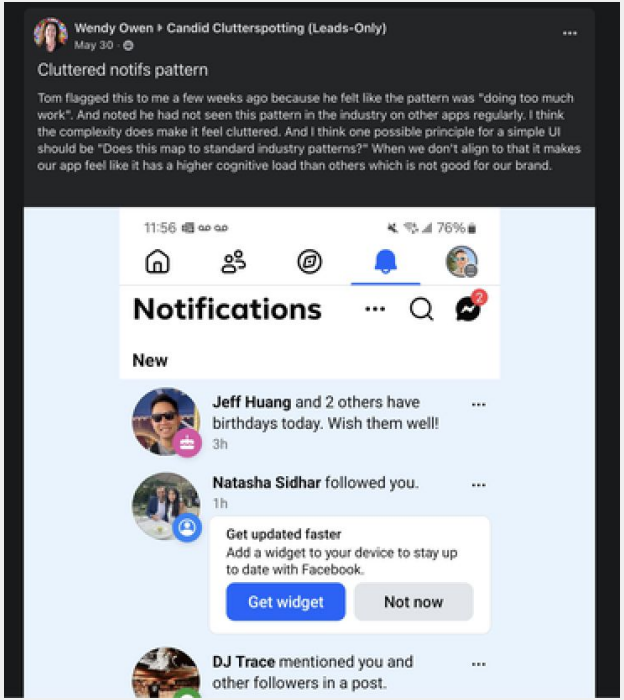
1. **Overflow CTA:** Today Secondary CTA is used as overglow to paginate or navigate users to secondary views. We plan to de-emphasize these CTAs in simplified Jewel



PAST FEEDBACK ON ACTIONS IN JEWEL



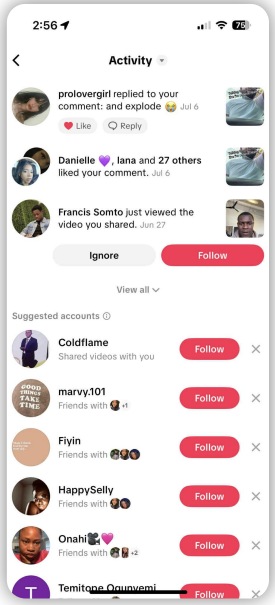
https://www.internalfb.com/tasks/?t=217410514



Competitors use actions sparingly, and in few use cases

TikTok

Lightweight and immediate actions. They're built around reciprocity and recommendations.



1. Feedback actions

Lightweight reciprocal actions only in comment reply case where user has sufficient context

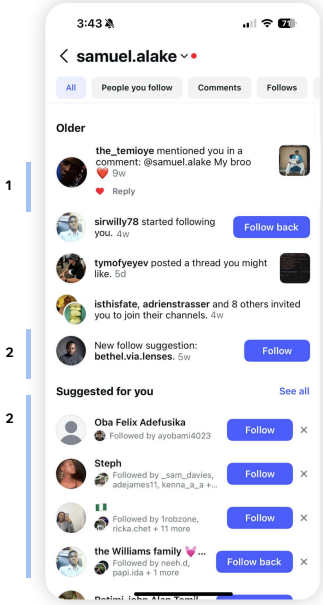
2. In-line CTAs

CTAs used in recommendation cases or in response to another action (i.e follow back).

Mostly represented as two binary actions when grouped

Instagram

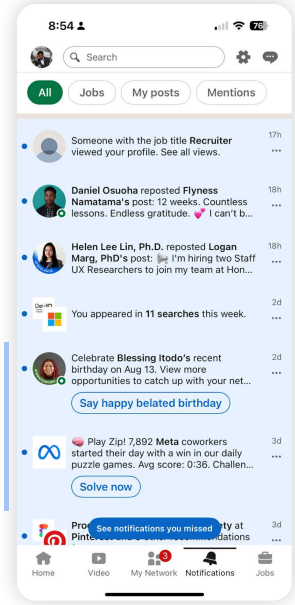
Also has lightweight and immediate actions built around reciprocity and recommendations.



LinkedIn

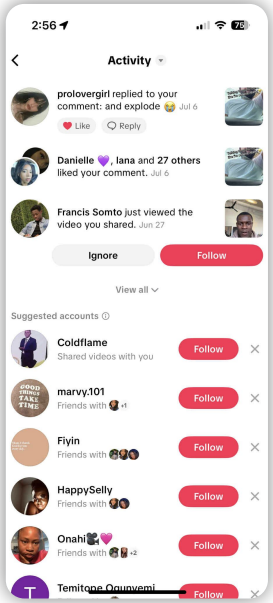
Has engagement prompts as CTAs, designed to drive interaction on notifications with social proof or professional recommendations.

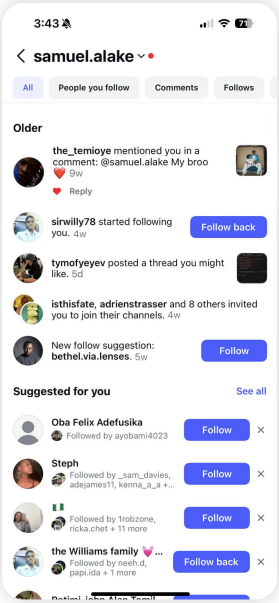
3. Engagement actions



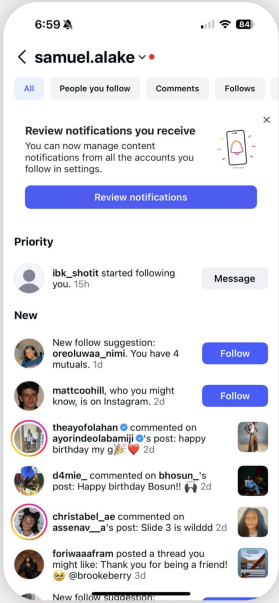
INDUSTRY PATTERNS ON SECTION + QP

Competitors use CTAs in dedicated section at the end of their notification

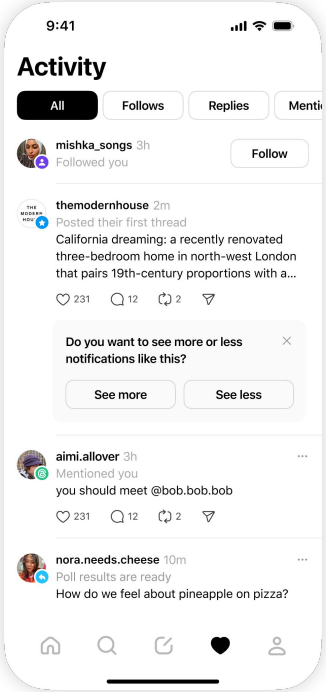


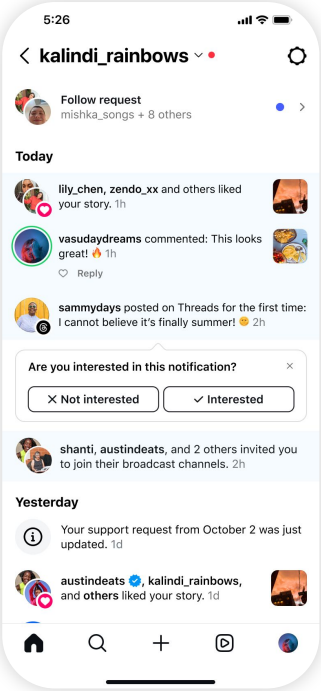


Competitors show QP for control *and enablement* related actions



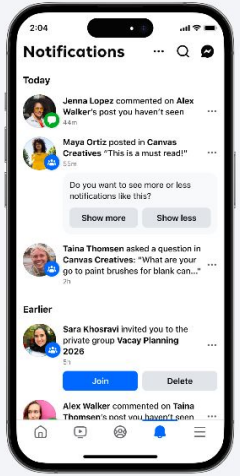
INDUSTRY PATTERNS ON CONTROL





ALTERNATE EXPLORATIONS

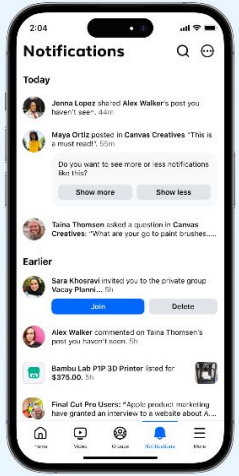
Before Simplification



-

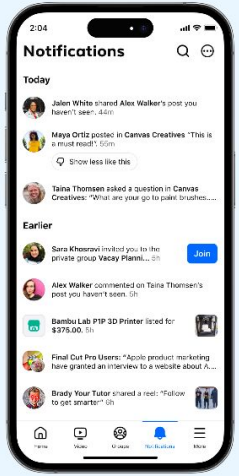
-

After Simplification



Simplest change

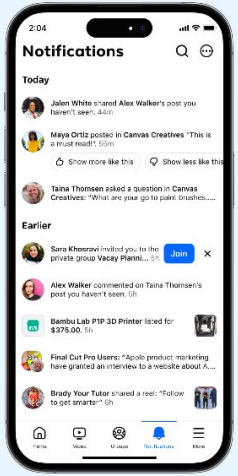
Reduce hierarchy of inline action and rich CTA elements



Trim down to most important action

For SM/SL: Rely on other implicit actions for positive signal and trim down explicit action to only negative signals.

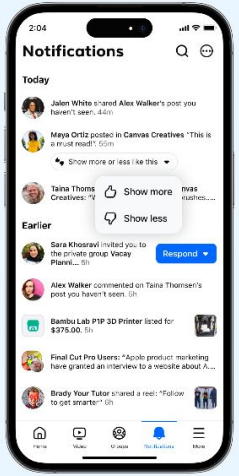
For Inline CTA (i.e Join): User can rely on other action like swiping to delete the notification to remove it



Continue showing multiple actions

Continue supporting binary actions in Jewel but in a different and de-emphasized style

Binary actions are listed in notification CTA guide as a guideline



Use menu button

Support multiple actions using menu button
